

Final Insight Summary

1. Executive Overview

The Superstore retail business delivered strong top-line performance, recording ₹1.05 Billion in Sales (+49.12% YoY) and ₹121.79 Million in Profit (+47.89% YoY). The overall profit margin stands at 11.61%.

While revenue momentum is healthy, profitability is being constrained by two controllable factors:

- Selective over-discounting on loss-making products
- Persistent underperformance in the Central region

The newly developed Power BI dashboard provides secure, self-service visibility for Regional Managers through Row-Level Security, enabling faster and more accountable decision-making.

2. Performance Highlights

Metric	Value	Insight
Total Sales	₹1.05 Bn	Exceptional growth, approaching 50% YoY
Total Profit	₹121.79 M	Healthy absolute growth
Profit Margin	11.61%	Under mild pressure from discounting
Total Orders	51,000	Solid transactional volume
Top Category	Technology	Highest sales contribution (₹0.39 Bn)
Leading Region	North	Clear internal benchmark

3. Key Business Insights & Recommendations

Category Performance

- Technology leads both sales and profit contribution. Furniture and Office Supplies trail, with certain Furniture SKUs showing negative profitability.
- **→ Recommendation:** Review Furniture SKU-level pricing and discounting; consider rationalizing persistently loss-making Furniture items

Final Insight Summary

Regional Performance

- North consistently outperforms all other regions and serves as the internal benchmark.
- Central underperforms throughout the year, indicating a structural execution gap rather than seasonal weakness.
- Root causes in Central include a higher concentration of discounted loss-making products and weaker sales-to-profit conversion.
- **→ Recommendation:** Launch a 90-day structured recovery plan for Central, using North's pricing, promotion, and discount practices as the benchmark.

Discount & Margin Leakage

- Discounts above 9% are heavily concentrated among loss-making products.
- "Tables – India" is the single largest margin drag, generating ₹6.28 Cr in sales but resulting in a ₹53.2 Lakh loss.
- Delivery performance is stable (15–16 days across categories), confirming that logistics is not the primary issue.
- **→ Recommendation:** Implement a 5–7% discount ceiling on historically loss-making SKUs (e.g., Tables – India), rather than a blanket discount cap across all products.

Customer Behaviour

- A small group of high-value customers contributes disproportionately to revenue.
- RFM analysis clearly separates high-value, high-frequency customers from at-risk segments.
- Purchase frequency and monetary value are distinct dimensions — high order count does not automatically equal high spend.
- Standard Class shipping emerges as the strongest driver of higher profit.
- **→ Recommendation:** Launch a targeted loyalty/win-back program for the Top 20 revenue customers, and prefer Standard Class shipping on margin-sensitive orders.

4. Strategic Recommendations — Consolidated

1. **Discount Discipline** — Implement a 5–7% discount ceiling only on historically loss-making SKUs (e.g., Tables – India). Avoid blanket discount restrictions.
2. **Central Region Recovery** — Launch a 90-day structured recovery plan using North region as the benchmark for pricing, promotion, and discount control.

Final Insight Summary

3. **Customer Retention Focus** — Design a targeted loyalty/win-back program for the Top 20 revenue-contributing customers.
4. **Seasonal Planning** — Align inventory build-up and promotional calendars with the proven Q4 (Nov–Dec) demand spike.
5. **Shipping Mode Optimisation** — Prefer Standard Class shipping on margin-sensitive orders, based on Key Influencers analysis.

5. Expected Business Impact

Initiative	Expected Outcome
Discount caps on loss-making SKUs	Direct recovery of eroded margin
Central region recovery plan	Closure of the largest regional performance gap
Top-20 customer retention	Protection of core revenue base
Q4-aligned planning	Reduced stockouts and overstock risk

6. Governance & Next Steps

Row-Level Security has been fully implemented and verified in Power BI Desktop, using two complementary approaches:

- **Static RLS** — five regional roles (Central, East, North, South, West), each restricted to its own region
- **Dynamic RLS** — a single role using `USERPRINCIPALNAME()`, automatically mapping each signed-in manager's login email to their region via the Users table; verified with "View As"

Immediate next steps:

- Publish the report to Power BI Service
- Assign managers to their respective RLS roles
- Establish a weekly data refresh schedule
- Review progress at 30 / 60 / 90-day intervals
